The Timoshenko-Ehrenfest beam theory was developed by Stephen Timoshenko and Paul Ehrenfest early in the 20th century. The model takes into account shear deformation and rotational bending effects, making it suitable for describing the behaviour of thick beams, sandwich composite beams, or beams subject to high-frequency excitation when the wavelength approaches the thickness of the beam.

Both the influence of rotational inertia and the shear stress induced from the effect of axial load proposed by Timoshenko and Gere will be considered. The stability behavior of cantilever Timoshenko beam resting on elastic foundation will be analyzed.

This problem is considered in Article 48 (p 214) of the Theory of Plates and Shells (Timoshenko, 1989) and the deflections and moments at points A and B are reported in the text (Table 47, p 219) for a Poisson's ratio of $\nu = 0.3$. This table has been reproduced in Figure 1 where D is the flexural rigidity of the plate and w is the transverse displacement.

Both matrices can be used in the stability, first- and the second-order elastic analyses of framed structures made of Timoshenko beam-columns with rigid, semi-rigid and simple connections of symmetric cross sections. The "modified" stability approach based on Haringx's model described by Timoshenko and Gere is utilized in all matrices.
